Preface	vi
1 Classical and quantum scattering	1
1.1 Experiments with nuclear particles	1
1.2 Theories and experiments	4
1.3 Reactions channels	6
1.4 Conservation laws	7
1.5 Kinematics of nuclear reactions	9
1.6 Cross sections, center of mass and laboratory frames	12
1.7 Classical scattering	19
1.8 The classical cross section	22
1.9 Example: Rutherford scattering	23
1.10 Orbiting, rainbow and glory scattering	25
1.11 Stationary scattering of a plane wave	29
1.12 Appendix 1.A - Systems of units	33
1.13 Appendix 1.B - Useful constants and conversion factors	35
1.14 Exercises	37
1.15 References	40
2 The partial-wave expansion method	41
2.1 The scattering wave function	41
2.2 Radial equation	41
2.3 Free particle in spherical coordinates	43
2.4 Phase shifts	45
2.5 Scattering amplitude and cross sections	49
2.6 Integral formulae for the phase-shifts	54
2.7 Hard sphere scattering	56
2.8 Resonances	56
2.9 Scattering from a square-well	59
2.10 Low energy scattering: scattering length	61
2.11 Scattering length for nucleon-nucleon scattering	64
2.12 The effective range formula	67

2.13	Effective range for nucleon-nucleon scattering	70
2.14	Coulomb scattering	73
2.15	An illustration: $\alpha - \alpha$ scattering	81
2.16	Appendix 2.A - Absolute phase shifts and Levinson Theorem	84
2.17	Exercises	88
2.18	References	90
3	Formal scattering theory	92
3.1	Introduction: Green's functions	92
3.2	Free particle's Green's functions	94
3.3	Scattering amplitude	97
3.4	Born approximation	99
3.5	Transition and scattering matrices	99
3.6	The two-potential formula	100
3.7	Distorted wave Born approximation	102
3.8	Partial-wave expansion of the S-matrix	103
3.9	Partial-wave free particle's Green's functions	108
3.10	Collision of particles with spin	111
3.11	Collisions of identical particles	115
3.12	Scattering of clusters of identical fermions	119
3.13	Imaginary potentials: absorption cross section	123
3.14	Appendix 3.A - Analytical properties of the S-matrix	131
3.15	Exercises	141
3.16	References	144
4	Compound nucleus reactions	145
4.1	Introduction	145
4.2	The nucleon-nucleon interaction	147
4.3	The nucleus as a strongly absorbing medium	155
4.4	Mean free path of a nucleon in nuclei	159
4.5	Fermi gas model	161
4.6	Formal theory of the optical potential	166
4.7	Empirical optical potential	170
4.8	Compound nucleus formation	178
4.9	R-matrix	190
4.10	Average of the cross sections	192
4.11	Level densities in nuclei	194
4.12	Compound nucleus decay: the Weisskopf-Ewing theory	198
4.13	Reciprocity theorem	202
4.14	The Hauser-Feshbach theory	203
4.15	Appendix 4.A - The shell model	205
4.16	Exercises	213
4.17	References	216

5	Fusion and Fission	218
5.1	Introduction	218
5.2	The liquid drop model	223
5.3	General considerations on fusion reactions	228
5.4	The one dimensional WKB approximation	229
5.5	Connection formulas in WKB	233
5.6	The three-dimensional WKB approximation	236
5.7	Heavy ion fusion reactions	241
5.8	Sub-barrier fusion	246
5.9	Superheavy elements	249
5.10	Occurrence of fission	254
5.11	Mass distribution of the fragments	257
5.12	Neutrons emitted in fission	260
5.13	Cross sections for fission	261
5.14	Energy distribution in fission	263
5.15	Isomeric fission	264
5.16	The nuclear reactor	267
5.17	Appendix 5.A - The Nilsson model	271
5.18	Exercises	273
5.19	References	276
6	Direct reactions	278
6.1	Introduction	278
6.2	Level width and Fermi's golden rule	280
6.3	Direct reactions: a simple approach	285
6.4	Direct reactions: detailed calculations	288
6.5	Applications of the shell model	294
6.6	Direct reactions as probe of the shell model	304
6.7	Nuclear vibrations	307
6.8	Photonuclear reactions - giant resonances	313
6.9	Coulomb excitation	318
6.10	Electromagnetic transition probabilities for nuclear vibrations	330
6.11	Nuclear excitation in the deformed potential model	339
6.12	Appendix 6.A - Multipole moments and the electromagnetic interaction	342
6.13	Exercises	346
6.14	References	349
7	Nuclear reactions in the cosmos	351
7.1	Cosmic rays	351
7.2	Stellar evolution: hydrogen and CNO cycles	355
7.3	White dwarfs and neutron stars	358
7.4	Synthesis of heavier elements	362
7.5	Supernovae explosions	364

7.6	Thermonuclear cross sections and reaction rates	368
7.7	Reaction networks	372
7.8	Models for astrophysical nuclear cross sections	373
7.9	Slow and rapid capture processes	384
7.10	Tests of the solar models	389
7.11	Indirect methods for nuclear astrophysics reactions	403
7.12	Exercises	411
7.13	References	420
8	High energy collisions	422
8.1	Introduction	422
8.2	Nucleons as billiard balls	422
8.3	Applications of the classical model	428
8.4	The eikonal wavefunction	438
8.5	Elastic scattering	440
8.6	Coulomb amplitude and Coulomb eikonal phase	441
8.7	Total reaction cross sections	444
8.8	Scattering of particles with spin	445
8.9	The optical limit of Glauber theory	447
8.10	Pauli blocking of nucleon-nucleon scattering	450
8.11	Glauber theory of multiple scattering	458
8.12	Coulomb excitation	461
8.13	Inelastic scattering	472
8.14	Charge-exchange reactions	475
8.15	Exercises	483
8.16	References	485
9	Relativistic collisions	487
9.1	Unpacking the nucleus	487
9.2	The Boltzmann-Uehling-Uhlenbeck equation	488
9.3	Wigner function	494
9.4	Numerical treatment of transport equations	502
9.5	Structure of hadrons	513
9.6	Quantum chromodynamics	521
9.7	The quark-gluon plasma	530
9.8	Exercises	533
9.9	References	534
